

Lecture 11.1 - Kernel Methods Kernelizing Linear Models

Erik Bekkers

(Bishop 6.0, 6.1)

Slide credits: Rianne van den Berg and Patrick Forré

So Far: Parametric Models

- Fixed basis function methods: $\phi(x) = (\phi_1(x), \phi_2(x), \dots, \phi_{M-1}(x))^T$
 - Linear regression: $y = \mathbf{w}^T \boldsymbol{\phi}(\mathbf{x}) + b$
 - Linear models for classification: $y = f(\mathbf{w}^T \boldsymbol{\phi}(\mathbf{x}) + b)$ Linear models for classification: $y = f(\mathbf{w}^T \boldsymbol{\phi}(\mathbf{x}) + b)$ Learnable basis functions: Neural networks

$$y(\mathbf{x}, \mathbf{W}^{(1)}, \mathbf{w}^{(2)}) = \sum_{m=0}^{M} w_m^{(2)} h(\sum_{d=0}^{D} w_{md}^{(1)} x_d)$$

- Training:
 - MLE, MAP: use training data to obtain point estimate of w
 - Full Bayesian: use training data to obtain posterior $p(\mathbf{w} | \mathbf{X}, \mathbf{t})$
- Test time: Discard training data, only need w or $p(\mathbf{w} \mid \mathbf{X}, \mathbf{t})$

Parametric vs Non-Parametric Models

- Parametric models = models with a finite number of parameters
- Non-Parametric models = models with no explicitly defined parameters (but *implicitly still* work with (finite) or infinite number of parameters)
- Parametric methods:
 - Working in the (finite dimensional) parameter space
- Non-Parametric methods
 - Directly working in possibly infinite dimensional function spaces
 - Typically we have $M \gg N$

Non-Parametric Kernel Methods

- Kernel methods: Use (subset) of training points for predictions (test time!). parametrizd by Useful if $M \gg N$
- Linear parametric models:
 - Can be re-cast into equivalent 'dual representation
 - Predictions are based on linear combinations of the kernel function evaluated at training data points
- For linear models with fixed feature vectors $\phi(\mathbf{x})$ we will encounter

$$k(\mathbf{x}, \mathbf{x}') = \boldsymbol{\phi}(\mathbf{x})^T \boldsymbol{\phi}(\mathbf{x}')$$

Kernel measures similarity between \mathbf{x} and \mathbf{x}' in feature space defined by mapping $\phi(\mathbf{x})$

$$k(\mathbf{x}, \mathbf{x}') = k(\mathbf{x}', \mathbf{x})$$

Kernelized Ridge Regression

Goal: Minimize sum of squared errors with quadratic weight penalty

$$J(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^{N} \{ \mathbf{w}^{T} \boldsymbol{\phi}(\mathbf{x}_{n}) - t_{n} \}^{2} + \frac{\lambda}{2} \mathbf{w}^{T} \mathbf{w}$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})^{T}$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})^{T}$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})^{T}$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})^{T}$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})^{T}$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n})^{T} + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n}) + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n})$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) \boldsymbol{\phi}(\mathbf{x}_{n}) + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n}) + \lambda \mathbf{I} \right)$$

$$\Rightarrow \mathbf{w}^{T} \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_{n}) + \lambda \mathbf{I} \right) = \sum_{n=1}^{N} t_{n} \boldsymbol{\phi}(\mathbf{x}_{n}) + \lambda \mathbf{I} \right)$$

$$\Leftrightarrow \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_n) \boldsymbol{\phi}(\mathbf{x}_n)^T + \lambda \mathbf{I}\right) \mathbf{w} = \sum_{n=1}^{N} t_n \boldsymbol{\phi}(\mathbf{x}_n)^T$$

$$\mathbf{w} = \left(\sum_{n=1}^{N} \boldsymbol{\phi}(\mathbf{x}_n) \boldsymbol{\phi}(\mathbf{x}_n)^T + \lambda \mathbf{I}\right)^{-1} \sum_{n=1}^{N} t_n \boldsymbol{\phi}(\mathbf{x}_n) = \left(\mathbf{\Phi}^T \mathbf{\Phi} + \lambda \mathbf{I}\right)^{-1} \mathbf{\Phi}^T t$$

Kernelized Ridge Regression

Goal: Minimize sum of squared errors with quadratic weight penalty

$$J(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^{N} \{ \mathbf{w}^{T} \boldsymbol{\phi}(\mathbf{x}_n) - t_n \}^2 + \frac{\lambda}{2} \mathbf{w}^{T} \mathbf{w}$$

Solution: Solve $\frac{\partial J(\mathbf{w})}{\partial \mathbf{w}} = 0$:

$$\mathbf{w} = \left(\mathbf{\Phi}^T \mathbf{\Phi} + \lambda \mathbf{I}_M\right)^{-1} \mathbf{\Phi}^T t,$$

 $\mathbf{\Phi}^T \mathbf{\Phi} \in \mathbb{R}^{MxM}$

Use matrix inversion lemma (see e.g. Bishop C.5):

$$(P^{-1} + B^T R^{-1} B)^{-1} B^T R^{-1} = P B^T (B P B^T + R)^{-1}$$

$$\lambda \Gamma_{n} + \phi^{-1} \Gamma_{n} \Phi^{-1} \Gamma_{n}$$

Allows us to alternatively obtain w via

$$\mathbf{w} = \mathbf{\Phi}^T \left(\mathbf{\Phi} \mathbf{\Phi}^T + \lambda \mathbf{I}_N \right)^{-1} t = \mathbf{\Phi}^T \left(K + \lambda \mathbf{I}_N \right)^{-1} t$$

With Gramm matrix $\mathbf{K} = \mathbf{\Phi}\mathbf{\Phi}^T$ with $K_{ij} = \boldsymbol{\phi}^T(\mathbf{x}_i)\boldsymbol{\phi}(\mathbf{x}_j)$

$$\mathbf{\Phi}^T \mathbf{\Phi} \in \mathbb{R}^{M \times M}$$

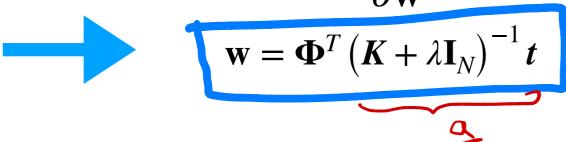

$$\begin{pmatrix} P^{-1} = \lambda \mathbf{I}_M \\ B = \mathbf{\Phi} \\ R = \mathbf{I}_N \end{pmatrix}$$

Kernelized Ridge Regression

Goal: Minimize sum of squared errors with quadratic weight penalty

$$J(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^{N} \{ \mathbf{w}^{T} \boldsymbol{\phi}(\mathbf{x}_n) - t_n \}^2 + \frac{\lambda}{2} \mathbf{w}^{T} \mathbf{w}$$

Solution: Solve $\frac{\partial J(\mathbf{w})}{\partial \mathbf{w}} = 0$:

$$K = \mathbf{\Phi}\mathbf{\Phi}^T, \ K_{ij} = \boldsymbol{\phi}^T(\boldsymbol{x}_i)\boldsymbol{\phi}(\boldsymbol{x}_j)$$

- Primal/dual viewpoint
 - Primal variable: $\mathbf{w} = \mathbf{\Phi}^T \mathbf{a}$

$$\underset{\mathbf{w},\mathbf{z}}{\arg\min} \frac{1}{2} \|\mathbf{z}\|^2$$
 with constraints $\mathbf{z} = \mathbf{\Phi}\mathbf{w} - \mathbf{t}$ and $\frac{1}{2} \|\mathbf{w}\|^2 \le R^2$

• Dual variable: $\mathbf{a} = (\mathbf{K} + \lambda \mathbf{I}_N)^{-1} \mathbf{t}$

$$\arg\min_{\mathbf{a}} \frac{1}{2} \mathbf{a}^T \mathbf{K} \mathbf{a} - \mathbf{a}^T \mathbf{t} + \frac{\lambda}{2} ||\mathbf{a}||^2$$

Predictive mean of primal viewpoint $y(\mathbf{x}', \mathbf{w}) = \mathbf{w}^T \boldsymbol{\phi}(\mathbf{x}')$

of dual viewpoint
$$y(\mathbf{x}', \mathbf{a}) = \sum_{n=1}^{N} a_n k(\mathbf{x}_n, \mathbf{x}')$$

Primal vs Dual/Kernel Approach

- Computational cost (closed form solutions):
 - The dual variables. $a = (K + \lambda I_N)^{-1} t$ $O(N^3)$
 - The primal variables $\mathbf{w} = (\mathbf{\Phi}^T \mathbf{\Phi} + \lambda \mathbf{I}_M)^{-1} \mathbf{\Phi}^T t$ $O(M^3)$
- Computational cost (predictions):
 - Dual case: $y(\mathbf{x}', \mathbf{a}) = \sum_{n=1}^{N} \alpha_n k(\mathbf{x}_n, \mathbf{x}')$ O(NM)
 - Primal case: $y(\mathbf{x}', \mathbf{w}) = \mathbf{w}^T \phi(\mathbf{x}')$ O(M)
- ► But... dual approach:
 - No explicit parameters (implicitly many!) -> nonparametric model
 - Does not rely on explicit features but on similarity kernel function.
 - Can be slow at prediction
 - Upcoming: Kernel methods with sparse solutions!

O(N'M)
